Last Update: 18 APR-2011

The TEWLS supports the intermediate medical logistics functions and consolidates national, regional, and deployed units into a single business environment. TEWLS compliments other applications within the Defense Medical Logistics Standard Support (DMLSS) portfolio and provides a capability for an enterprise "backbone" for centralized management of data and key intermediate level medical logistics processes. This includes warehousing of medical materiels, materiel distribution and transportation management, and creation and management of medical assemblages.

Product Features

❑ Provides single data entry and instantaneous data sharing across the DoD medical logisticians to support Logistics Enterprise

❑ Creates links for planners, commercial partners, and DoD medical logisticians to support care in the theater through a single 'customer facing' portal

❑ Currently supports theater-level medical materiel management, warehousing, distribution functions, and medical assemblage creation, build, and management

Benefits to the Military Health System

❑ Single application and database – and enterprise catalog – for life cycle management of all medical assemblages and theater intermediate-level supply chain management.

❑ Eliminates several legacy logistics systems and standardizes globally recognized world-class business practices.
