# JOINT OPERATIONAL MEDICINE INFORMATION SYSTEMS AHLTA-THEATER DEPLOYED OUTPATIENT DOCUMENTATION SOLUTION

AHLTA-Theater is the configuration of AHLTA, the military's legacy electronic health record in theater for all Department of Defense military treatment facilities worldwide.

## PROGRAM OVERVIEW

AHLTA-Theater is the deployed outpatient clinical documentation solution. AHLTA-Theater is a fully compatible and deployable system that looks, feels and functions similar to AHLTA but is tailored to operate in theater. AHLTA-Theater operates on a laptop computer or in a client server environment. The system supports documentation of clinical care whether connected to a network or as a stand-alone.

AHLTA-Theater functions in low- and no-communication environments by utilizing a unique store-and-forward capability that allows data to be stored in a local database until connectivity to the internet is restored. When authorized network connections become available, data automatically passes to the central theater database, the Theater Medical Data Store (TMDS).

## FEATURES

-  Enables patient encounter documentation at a wide range of treatment facilities
-  Works in low- and no-communication environments (store-and-forward)
-  Interfaces with Marine Maritime Modules and TMIP-Composite Health Care System Cache
-  Features order management capability
-  Offers theater administration/theater security (e.g., create clinics, manage users)
-  Allows users to import patient demographic data from authoritative data sources
-  Provides drug-drug/drug-allergy interaction screening
-  Includes alternate input method (AIM) forms for clinical provider use

## BENEFITS

-  Improves system availability, reliability and sustainability
-  Enables the Military Health System to achieve a paperless record
-  Enhances the delivery of patient care in a theater environment
-  Allows for complete and accurate health care documentation across the continuum of care
-  Increases clinical and administrative efficiency
