Mosquitoes?
Not in my backyard!

Backyard mosquitoes can transmit diseases such as Chikungunya, Dengue Fever, and Zika.

Mosquitoes can develop in a spoon-full of water.
Empty any standing water around your home.

Clogged Gutters  Toys left outside  Rain Barrels
Pools & Tarps  Plant Pots & Saucers  Bird Baths
Tires  Buckets

These mosquitoes do not fly far from where they’re breeding.
If you are being bitten, they’re breeding nearby!
Protect yourself and your family

1. Remove any standing water in your yard
2. Use a lotion or spray with an EPA approved insect repellent with at least 20% Picaridin or DEET and/or IR3535.
3. Wear clothing treated with a long-lasting insecticide such as Permethrin
