The Honorable Carl Levin  
Chairman  
Committee on Armed Services  
United States Senate  
Washington, DC 20510  

Dear Mr. Chairman:  

This is the final response to Senate Report 112-196, page 231, accompanying H.R. 5856, the Department of Defense Appropriations Bill, 2013, which requests the Secretary of Defense to submit a report explaining the criteria used to evaluate the effectiveness of integrative medicine programs, the result of those evaluations, and the number of Service members receiving integrative medical treatment by Service and location of medical care. The enclosed report further outlines the Department’s plans for future expansion of the evaluation and implementation of integrative medicine for broader military application.  

Thank you for your interest in the health and well-being of our Service members, veterans, and their families. A similar letter is being sent to the other congressional defense committees.  

Sincerely,  

[Signature]

Enclosure:  
As stated

EXECUTIVE SUMMARY

INTRODUCTION: The report responds to Senate Report 112-196, page 231, accompanying H.R. 5856, the Department of Defense Appropriations Bill, 2013, page 231, which requests the Secretary of Defense to submit a report explaining the criteria used to evaluate the effectiveness of integrative medicine programs, the result of those evaluations, and the number of Service members receiving integrative medical treatment by Service and location of medical care within the Military Health System (MHS). The report also includes plans for future expansion of these programs.

FINDINGS: The review found that 120 Military Treatment Facilities (MTFs), 99 in the continental United States (CONUS) and 21 outside the continental United States (OCONUS), offer a total of 275 complementary and alternative medicine (CAM) programs. Active duty (AD) military members used 213,515 CAM patient visits in calendar year (CY) 2012 with the most visits for chiropractic care (73%) and acupuncture therapy (11%). In addition, the United States Army (USA) Medical Research and Materiel Command (MRMC) funds CAM related research to identify safe and effective therapies to treat MHS patients.

EVALUATION: Various assessment tools are being utilized by many of the sites offering CAM therapies. Patient assessment/feedback, qualitative assessment by the provider, pre- and post-appointment questionnaires, patient satisfaction questionnaires, and measurement of physical improvement are being used to evaluate the CAM therapies offered to AD military members. Patients reported improvement in symptoms, reduction in anxiety, improved sleep and decline in psychological symptoms across the CAM modalities in use.

CONCLUSION: There is wide-spread use of CAM therapies across the MHS. Providers and patients were interested in using CAM therapies even though many are not evidence-based. Some providers have added CAM therapies as an adjunct to conventional therapies for a holistic approach to patient management.

RECOMMENDATIONS: Part 199 of Title 32, the Code of Federal Regulations (CFR) provides criteria to use to determine whether a therapy is safe and effective. The MHS will evaluate CAM programs for safety and effectiveness, as well as cost-effectiveness. As resources allow, the Department will consider widespread implementation in the MHS of cost-effective CAM programs meeting TRICARE guidelines for safety and effectiveness.
INTRODUCTION:

Senate Report 112-196, Title VI, page 231, to accompany the Consolidated and Further Contingency Appropriations Act, for Fiscal Year 2013 signed into law on March 26, 2013, requested the Secretary of Defense to submit a report to the congressional defense committees NLT 180 days after enactment of the act. The report should provide “an explanation of the criteria used to evaluate the effectiveness of integrative medicine programs, the results of those evaluations, and the number of servicemembers receiving integrative medical treatment—by service and location of medical care. The report should further outline the Department’s plans for future expansion of the evaluation and implementation of integrative medicine for broader military application.” The report addresses the interests of the Senate Appropriations Committee (SAC).

BACKGROUND:

Healthcare in the United States (US) is mostly accessed and delivered under a conventional or Western medicine model. The National Institutes of Health (NIH) defines conventional medicine as “a system in which medical doctors and other healthcare professionals (such as nurses, pharmacists, and therapists) treat symptoms and diseases using drugs, radiation, or surgery.” Treatments in conventional medicine are often the result of rigorous research and evaluation and must prove to be safe and efficacious before being adopted as acceptable treatment or “standard of care.” Still, these proven methods do not always resolve the patient’s medical issue.

The attitudes or practices of conventional medicine coupled with unresolved medical issues have led to demands by patients for changes in medicine. Integrative medicine is a response to these patient demands. The National Center for Complementary and Alternative Medicine (NCCAM) at the NIH, defined integrative medicine as “the combining of treatments from conventional medicine and CAM for which there is some high-quality evidence of safety and effectiveness.” In addition, NCCAM refers to alternative medicine as the use of a non-mainstream approach in place of conventional medicine. Complementary medicine generally refers to using a non-mainstream approach together with conventional medicine. In 2002, NCCAM defined CAM as “a group of diverse medical and health care systems, practices, and products that are not presently considered to be part of conventional medicine.”

The 2000 White House Commission on Complementary and Alternative Medicine Policy report documented the growing use of CAM, revealing that most people used CAM in conjunction with, rather than as a replacement for, conventional medical therapy. The report also noted that patients sought conventional medical treatment first before turning to CAM practitioners, and that many patients combined care from a variety of approaches (White House Commission on Complementary and Alternative Medicine Policy, 2001).

In 2002, in response to the increased use of CAM services, 16 NIH institutes, centers, and offices, and the Agency for Healthcare Research and Quality commissioned the Institute of
Medicine (IOM) to describe the use of CAM therapies by the American public. The 2005 IOM report on CAM noted that patients sought CAM therapies because:

- Conventional medicine does not work well for the complaint
- Lack of trust in and disenchantment with health care system
- Dissatisfaction with previous treatment outcomes
- Looking for more patient-centered approach
- CAM enables the patient to play a more active and participative role in care
- CAM enables the patient to manage and conserve the use of valued conventional medications
- Prevent future illness or to maintain health and vitality

The final IOM recommendations noted that new and current therapies (both alternative and conventional) that have not been studied must be studied for effectiveness. In addition, model guidelines of care delivery involving CAM therapies need to be developed. The IOM suggests the ultimate goal should be to provide comprehensive care that:

- is based on best available scientific evidence on benefits and harm
- recognizes the importance of compassion and caring
- encourages patients to share in decision making regarding therapeutic options
- promotes choices in care that can include CAM therapies when appropriate

Integrative medicine is a care delivery system providing comprehensive care as stated in the IOM report. This emerging field seeks to build a bridge between conventional and alternative medical systems and to find therapeutic and cost effective ways to combine them so as to have “the best of both worlds” while still maintaining the integrity of each system. The MHS is offering selected CAM therapies with the conventional medical system.

DATA COLLECTION FOR CAM PROGRAMS:

A request for information was sent by the Office of the Chief Medical Officer, TMA to each of the Military Departments. The Military Departments were asked to provide information about the type of CAM programs currently provided at their MTFs, their location, AD patient visits for CY 2012, the evaluation criteria in use, if applicable, and any results available.
FINDINGS:

Twenty-nine percent (120) of 421 MTFs reported offering a total of 275 CAM programs. Ninety-nine of these MTFs were located in CONUS in thirty-seven States, and twenty-one were in OCONUS locations. The types of CAM programs available at the 120 MTFs are acupuncture, biofeedback, breath-based practices, chiropractic care, clinical nutrition therapy, cognitive behavioral therapy, massage, meditation, naturopathic medicine, spiritual prayer based practices, and yoga. The most commonly offered CAM programs are acupuncture and clinical nutrition therapy followed by chiropractic care. Sixty-nine US Air Force (USAF) MTFs offered acupuncture, chiropractic, and/or clinical nutrition programs. Twenty-five US Navy (USN) MTFs offered acupuncture and/or chiropractic programs. Fourteen (58%) offered both therapies. The US Army (USA) MTFs offered the greatest variety of CAM programs with chiropractic programs having the highest utilization. The MTFs in the Joint Task Force National Capital Region Medical Command (JTF-CapMed) offered 3 CAM programs: two acupuncture and one chiropractic. A listing of CAM programs by Service and location is in Appendix A.

AD patient utilization data for CY 2012 were available for 207 clinics offering CAM programs. AD patients utilized 213,515 CAM patient visits in 2012. A summary of the findings are in the following table:

The most commonly utilized CAM programs are chiropractic care and acupuncture followed by clinical nutrition therapy. Seventy-three percent of the 213,515 patient visits made by AD patients were for chiropractic care. The remaining 27% of visits were distributed among ten types of CAM programs. The following table lists the CAM programs with the percentage of utilization:

Some of the sites offering CAM programs are not rigorously evaluating care and, therefore, not all programs reported evaluation results. For sites reporting evaluation results, the following criteria are being used: Defense Veterans Pain Scale, patient assessment/feedback, provider qualitative evaluation, pre- and post-appointment questionnaires to assess physical and psychological benefits, and measurement of physical improvements such as increased range of motion. Patients reported a reduction in anxiety levels and improved sleep with meditation. Breath based practices reportedly helped patients to remain sober and reduced overall stress levels. Patients using massage therapy noted 75% improvement of symptoms. Overall, positive outcomes were reported by 50-90% of patients using massage therapy. Patients practicing yoga reported declines in psychological symptoms and improvement in overall health.

In addition, the USA MRMC funds thirty CAM related research projects to identify safe and effective therapies to treat MHS patients. Six are at military sites, 8 are at Veterans Affairs (VA) sites and 16 are at civilian sites. Funding of an additional four proposals is pending. The currently funded programs are in Appendix B.

### DISCUSSION:

Part 199 of Title 32, CFR, governs TRICARE benefits and restricts services to those medically necessary drugs, devices, treatments, or procedures for which safety and efficacy have been proven to be comparable or superior to conventional therapies. Established criteria state that unproven drugs, devices, treatments, or procedures may not be covered:
1) Unless reliable evidence shows that any medical treatment or procedure has undergone well-controlled clinical studies that show maximum tolerated dose, toxicity, safety, or efficacy compared with standard treatment or diagnosis.

2) If the available reliable evidence is considered inadequate by experts who recommend further studies or clinical trials are needed.

The criteria for making a determination of proven safe and effective to nationally accepted medical standards are evidence that comes from:

1) Well controlled studies of clinically meaningful endpoints published in referred medical literature;

2) Published formal technology assessments;

3) Published reports of national professional medical associations;

4) Published reports of national expert opinion organizations.

In relation to CAM therapies, Title 32 CFR section 199.4 (e) states:

“(17) Biofeedback Therapy. Biofeedback therapy is a technique by which a person is taught to exercise control over a physiologic process occurring within the body. By using modern biomedical instruments the patient learns how a specific physiologic system within his body operates and how to modify the performance of this particular system.

(i) Benefits provided. CHAMPUS benefits are payable for services and supplies in connection with electrothermal, electromyograph and electrodermal biofeedback therapy when there is documentation that the patient has undergone an appropriate medical evaluation, that their present condition is not responding to or no longer responds to other forms of conventional treatment, and only when provided as treatment for the following conditions:

   (A) Adjunctive treatment for Raynaud’s Syndrome.

   (B) Adjunctive treatment for muscle re-education of specific muscle groups or for treating pathological muscle abnormalities of spasticity, or incapacitating muscle spasm or weakness.

(ii) Limitations. Payable benefits include initial intake evaluation. Treatment following the initial intake evaluation is limited to a maximum of 20 inpatient and outpatient biofeedback treatments per calendar year.

(iii) Exclusions. Benefits are excluded for biofeedback therapy for the treatment of ordinary muscle tension states or for psychosomatic conditions. Benefits are also excluded for the rental or purchase of biofeedback equipment.
(iv) Provider Requirements. A provider of biofeedback therapy must be a CHAMPUS authorized provider. (Refer to Sec. 199.6, ‘Authorized Providers’). If biofeedback treatment is provided by other than a physician, the patient must be referred by a physician.”

The following CAM therapies are excluded in Title 32 CFR section 199.4 (g):

“Exclusions and limitations. In addition to any definitions, requirements, conditions, or limitations enumerated and described in other sections of this part, the following specifically are excluded from the Basic Program:

(38) Chiropractors and naturopaths. Services of chiropractors and naturopaths whether or not such services would be eligible for benefits if rendered by an authorized provider.

(40) Acupuncture. Acupuncture, whether used as a therapeutic agent or as an anesthetic.”

Even though chiropractic therapy is restricted in Title 32 CFR 199.4 (g) (38), chiropractic care was initiated in Fiscal Year (FY) 2003 at 22 MTFs under section 702 of the Floyd D. Spence National Defense Authorization Act for FY 2001. Congressional action allowed additional MTFs to provide chiropractic care in 2004 and 2007. Subject to the availability of resources, chiropractic care is provided by contract providers for AD Service members only.

Even with these rules and restrictions, the findings indicate that innovators in the MHS have initiated some CAM programs even though there is insufficient evidence to establish these therapies as TRICARE benefits. Some programs indicated they are meeting needs of patients in accordance with the tenets of integrative medicine and the trend supported by NCCAM and the IOM reports. Even though the results reported were limited, the data suggests that patients were satisfied with the results and indicated a positive impact on their health status. In addition, as noted previously, the MHS is funding CAM research to determine the safety and effectiveness of such therapies.

CONCLUSIONS:

There is wide-spread use of CAM therapies across DoD in both CONUS and OCONUS MTFs. Providers in many MTFs have added CAM therapies as an adjunct to conventional therapies for a more holistic approach to patient treatment and management. The most frequently offered CAM programs are acupuncture, clinical nutrition therapy and chiropractic care. However, many CAM therapies are being offered without having established formal evaluation criteria for safety and effectiveness. As noted by the IOM, both conventional and CAM therapies need to be studied and subjected to the same scientific rigor. The MHS recognizes the need for the Military Departments to provide oversight and monitor the delivery of CAM programs to ensure rigorous evaluation criteria are utilized; document successful models of care; and publicize the results across the MHS.
RECOMMENDATIONS:

As noted, the Department must follow TRICARE guidelines to determine health benefits that may be offered to beneficiaries. The TRICARE guidelines require that therapies offered as part of the benefit must be medically necessary, safe and effective. At this time, there are insufficient internal evaluation and reported results to determine whether the CAM programs being provided in the MTFs meet these criteria. Therefore, the MHS will evaluate CAM therapies for safety and effectiveness prior to any further expansion of CAM programs. Meanwhile, the MHS will continue to review the literature, the findings and recommendations of external organizations such as the IOM and NCCAM, and internal results of CAM program assessments to identify those CAM programs that may enhance conventional therapies. Identified programs proven safe and effective will be considered for widespread implementation in the MHS as resources allow.
