## Deployment Health Assessments U.S. Armed Forces

May 2020

(Data through April 2020)

Armed Forces Health Surveillance Branch

Report Date: 20 May 2020

## Update: Deployment Health Assessments, U.S. Armed Forces, May 2020

Since January 2003, pronounced fluctuations in the monthly numbers of pre- and post-deployment health assessment (PDHA) forms transmitted to the Armed Forces Health Surveillance Branch (AFHSB) generally have corresponded to times of departure and return of large numbers of service members who deployed. For the purposes of this report about service members' responses to the assessment questions, it is important to note that the denominator is the total number of service members who completed deployment-related assessments, not the total number of service members eligible for the assessments.

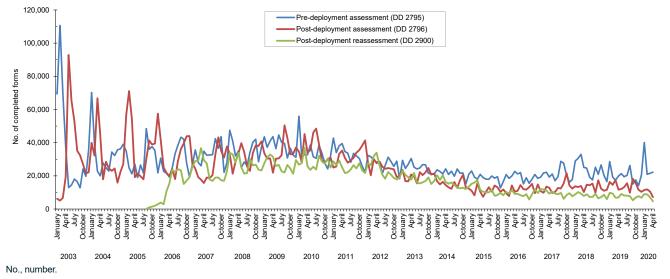

From January 2015 through April 2020, monthly counts of pre-deployment health assessment forms showed the greatest variation compared to the other deployment health assessment forms (Figure 1). The most pronounced fluctuations in monthly counts of pre-deployment health assessment forms during this period occurred from June 2017 through April 2020. (Figure 1). For the past 8 years, counts of post-deployment health reassessment (PDHRA) forms showed a pronounced downward trend; since June 2017, the monthly counts of these questionnaires were consistently lower than the monthly counts of PDHA forms. Moreover, the average monthly number of PDHRA forms (7,435) during the most recent 12 months (May 2019–April 2020) was the single lowest 1-year average since July 2006 (Table 1, data not shown). Also of note, the average monthly number of PDHA forms (12,300) during the most recent 12-month period was the lowest 1-year average since September 2017 (data not shown).

During the past 12 months, the percentages of total returned deployers who rated their health as either "fair" or "poor" ranged from 6.8% to 10.0% on PDHA questionnaires and from 7.2% to 9.2% on PDHRA questionnaires (**Figure 2**). The percentages of total service members who rated their health as either "fair" or "poor" on pre-deployment questionnaires during this period varied between 2.3% and 5.6%.

In general, the percentages of "exposure concerns" self-reported on PDHA and PĎHRA forms were higher among reserve component members than among active component members; a similar pattern is apparent for the percentages of "health concerns" self-reported on PDHA forms (Table 2, Figure 3). Active component Marine Corps members were 1.7 times as likely to report 2 or more PTSD symptoms at the time of the PDHRA compared to the time of the PDHA (Table 2).

At the time of return from deployment, 17.9% of active component and 17.8% of reserve component service members reported any depression symptoms. Service members in the active and reserve components were 4.0 and 7.9 times as likely, respectively, to receive a mental health referral 3-6 months after deployment, compared to the time of their return from deployment. Moreover, at the time of the PDHRA, reservists were 2.0 times as likely to receive a mental health referral as members of the active component (Table 2).
