DoD Consolidated Influenza Surveillance Report

Week 50 (06 Dec 2020 — 12 Dec 2020)

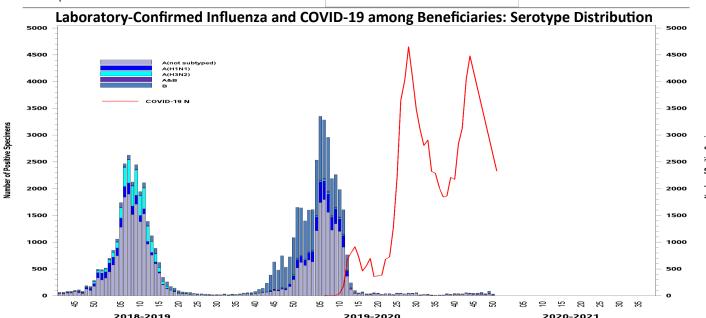

One Page Summary: Weekly Highlights

- Laboratory-confirmed influenza cases, dispensed antiviral prescription counts, and inpatient counts among all beneficiaries remained very low.
- COVID-19 mitigation efforts are likely contributing to the lower than normal influenza activity levels.
- Among active component Service Members, laboratory-confirmed influenza cases and antiviral prescriptions remained low.
- ILI activity was minimal for the majority of installations.
- COVID-19 cases are accounting for 99% of all influenza and COVID-19 cases combined.
- There were no laboratory-confirmed influenza hospitalizations reported for week 50 (Season total: 3).

Influenza Surveillance Indicators (2020-2021 season)

All Beneficiaries	Total Per Week		Trend	Activity Level
Laboratory Cases	31		4 Þ	Low
Dispensed Antivirals	65		4 Þ	Low
Severity				Activity Level
Inpatient Laboratory Cases	1		4 Þ	Low
Inpatient Dispensed Antivirals	1		4 Þ	Low
Active Component				Activity Level
Laboratory Cases	14		4 Þ	Low
Dispensed Antivirals	11	p-0	4>	Low
ILI Outpatient Visits	1%		4>	Minimal
Laboratory-Confirmed	d Influenza and CO	VID-19 among Beneficiaries: S	erotype	Distribution

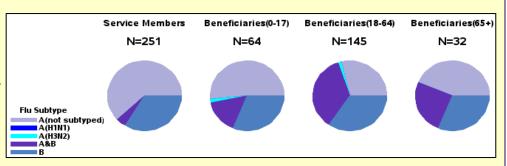

Disclaimer: Influenza lab data are not available from sites that have transitioned to MHS Genesis and encounter data may be delayed. Therefore, these sites are not included in the lab portion of this report and the accuracy of the activity levels may be impacted.

Page 1 12/18/2020

Confirmed Influenza and COVID-19 Cases (2020-2021 Season: Week 50)

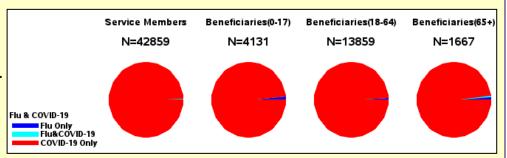

Number and Distribution of Influenza Positive Specimens since week 41, by Beneficiary Status and Serotype

The majority of positive specimens continued to be among
 Service Members (SM) (251). Influenza A (not subtyped) predominated among SM and beneficiaries (0-17), while the remaining beneficiaries had a relatively equal mix of subtypes.

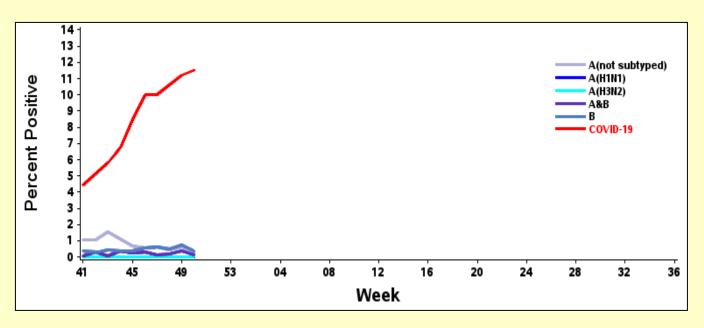

Number and Distribution of Influenza Positive Specimens and COVID-19 Cases since week 41, by Beneficiary Status

 COVID-19 cases continue to predominate among all beneficiary categories, representing 99% of the influenza and COVID-19 cases. The majority of COVID-19 cases since week 41 were among Service Members (42,859).

Percent of Specimens Positive for Influenza (by Serotype) or COVID-19

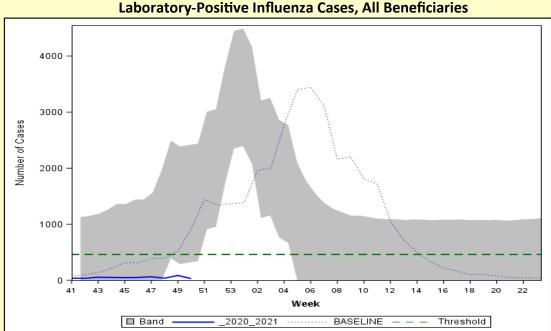

• The percent of specimens positive for influenza decreased slightly and remained very low. The percent of specimens positive for SARS-CoV-2 continued to increase and was 11.5% for week 50.

Disclaimer: Influenza lab data are not available from sites that have transitioned to MHS Genesis and encounter data may be delayed. Therefore, these sites are not included in the lab portion of this report and the accuracy of the activity levels may be impacted.

Laboratory-Confirmed Influenza (2020-2021 Season: Week 50)

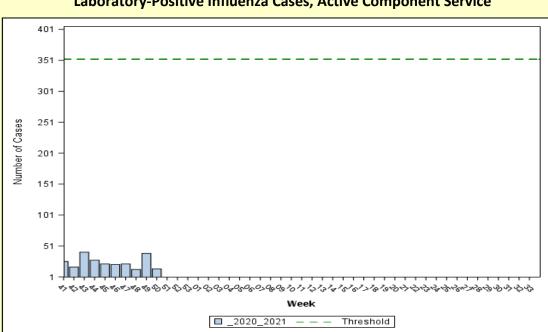

The number of laboratory-confirmed influenza cases among all beneficiaries decreased slightly and remained very low and below baseline and the threshold.

Band indicates one standard deviation above and below seasonal baseline estimates. Threshold indicates two standard deviations above offseason average.

Laboratory-Positive Influenza Cases, Active Component Service

- The number of active component Service Member laboratoryconfirmed influenza cases decreased and remained low and well below the threshold.
- Threshold indicates two standard deviations above seasonal baseline estimates.

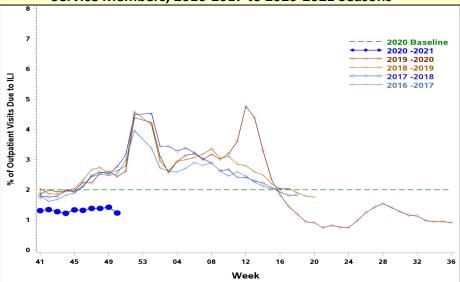

Disclaimer: Influenza lab data are not available from sites that have transitioned to MHS Genesis and encounter data may be delayed. Therefore, these sites are not included in the lab portion of this report and the accuracy of the activity levels may be impacted.

3 12/18/2020

ILI and Dispensed Antiviral Prescriptions (2020-2021 Season: Week 50)

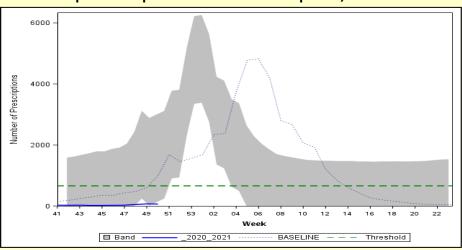

Percent of Outpatient Visits Due to ILI: Service Members, 2016-2017 to 2020-2021 Seasons

- The percentage of outpatient visits due to ILI decreased and remained very low and well below baseline and prior seasons since week 16 of 2020.
- COVID-19 mitigation efforts are likely contributing to the lower than normal number of ILIs.

Influenza-Specific Dispensed Antiviral Prescriptions, All Beneficiaries

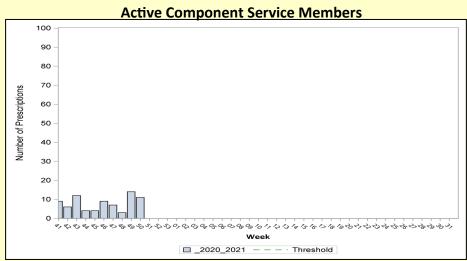

- Influenza-specific dispensed antiviral prescriptions among all beneficiaries increased slightly, but remained very low and well below the weekly baseline and threshold.
- Band indicates one standard deviation above and below seasonal baseline estimates. Threshold indicates two standard deviations above off-season average.

Influenza-Specific Dispensed Antiviral Prescriptions:

 The number of influenza-specific dispensed antiviral prescriptions among active component Service Members decreased slightly, but remained very low.

 Threshold indicates two standard deviation above the overall weighted average during the season. However, there is not enough data for the season yet to calculate the threshold for this metric.

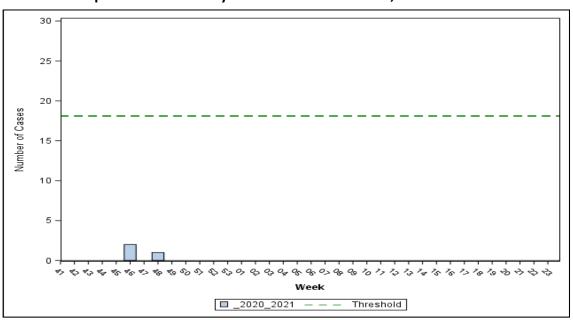

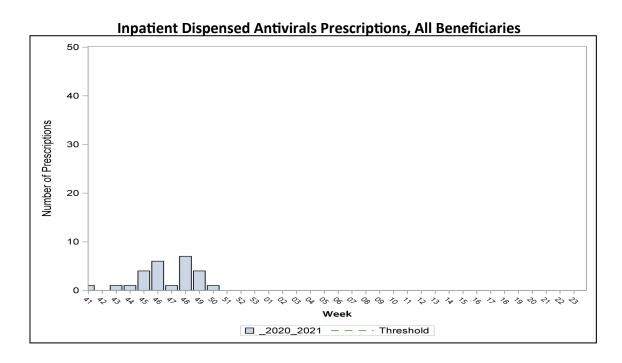

Disclaimer: Influenza lab data are not available from sites that have transitioned to MHS Genesis and encounter data may be delayed. Therefore, these sites are not included in the lab portion of this report and the accuracy of the activity levels may be impacted.

Severity: Hospitalized Influenza Metrics (2020-2021 Season: Week 50)

- There were no laboratory-confirmed influenza hospitalizations reported during week 50. (Season total: 3).
- The number of inpatient influenza-specific dispensed antiviral prescriptions decreased and remained very low.
- Thresholds indicates one standard deviation above the overall weighted average during the season. However, there is not enough data for the season yet to calculate thresholds for these metrics.

Hospitalized Laboratory-Positive Influenza Cases, All Beneficiaries

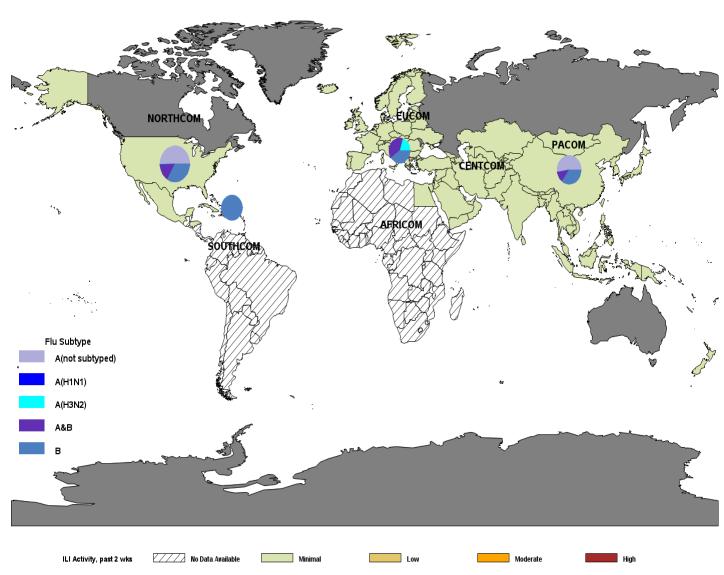

Disclaimer: Influenza lab data are not available from sites that have transitioned to MHS Genesis and encounter data may be delayed. Therefore, these sites are not included in the lab portion of this report and the accuracy of the activity levels may be impacted.

Influenza Activity: Geographic Combatant Command

(2020-2021 Season: Week 50)

- ** The COVID-19 outbreak and its associated mitigation efforts occurring across the world, as well as lower healthcare seeking behavior, may have impacted ILI activity levels.
- NORTHCOM: ILI activity was minimal. The number of laboratory-confirmed influenza cases remained very low; the majority being Influenza A (not subtyped).
- EUCOM: ILI activity was minimal. Only 5 influenza positive specimen have been reported for the season.
- INDOPACOM: ILI activity was minimal. Only a small number of laboratory-confirmed influenza positive specimens have been reported.
- SOUTHCOM: ILI activity was minimal. Only 1 specimen has tested positive for influenza this season (influenza B).
- CENTCOM: ILI activity was minimal at the command level, but at the country level Kuwait had moderate activity.

ILI Activity (Service Members) and Laboratory-Confirmed Influenza (All Beneficiaries)

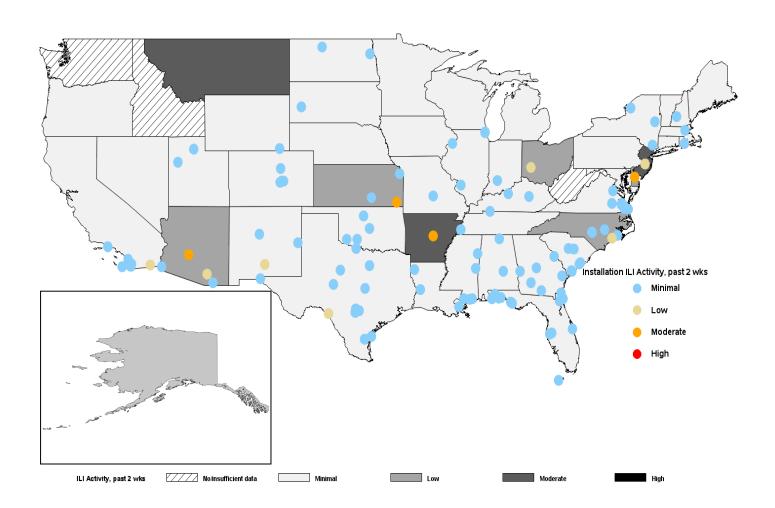

^{*}Locations colored in dark gray have no Service Member medical encounter data.

Influenza Activity: NORTHCOM (2020-2021 Season: Week 50)

- ** The COVID-19 outbreak and its associated mitigation efforts occurring across the world, as well as lower healthcare seeking behavior, may have impacted ILI activity levels.
- The majority of installations had minimal ILI activity, however Dover AFB, Fort Riley, Little Rock AFB, and Luke AFB had moderate ILI activity during week 50.
- The majority of states had minimal ILI activity, however Montana, Arkansas, and New Jersey had moderate activity.
- State level data includes both Military Treatment Facility (MTF) and outsourced care. Therefore, state activity levels may differ from the installation level data.
- Installation-level laboratory-confirmed influenza and COVID-19 case data can be found on pages 14-19 of the report.

ILI Activity (Service Members) by State and Installation

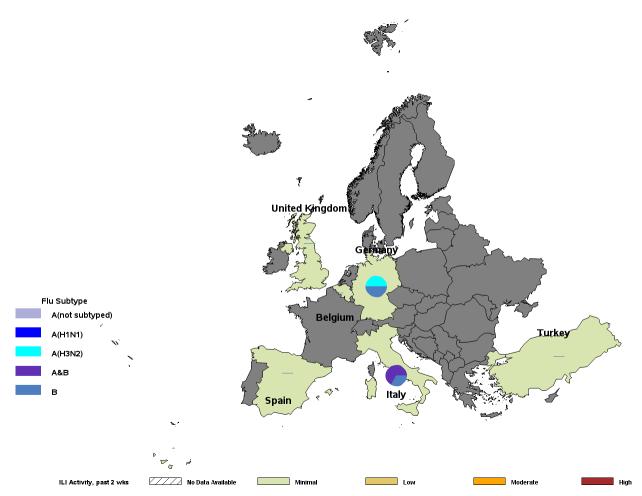

Disclaimer: Influenza lab data are not available from sites that have transitioned to MHS Genesis and encounter data may be delayed. Therefore, these sites are not included in the lab portion of this report and the accuracy of the activity levels may be impacted.

Influenza and COVID-19 Activity: EUCOM (2020-2021 Season: Week 50)

- ** The COVID-19 outbreak and its associated mitigation efforts occurring across the world, as well as lower healthcare seeking behavior, may have impacted ILI activity levels.
- ILI activity was minimal in all countries with available data.
- Only five laboratory-confirmed influenza cases have been reported for EUCOM this season.
- Installation-level laboratory-confirmed influenza and COVID-19 case data for EUCOM can be found on page 9 of the report.

ILI Activity (Service Members) and Laboratory-Confirmed Influenza (All Beneficiaries)

^{*}Locations colored in dark gray have no Service Member medical encounter data.

Influenza Activity: INDOPACOM (2020-2021 Season: Week 50)

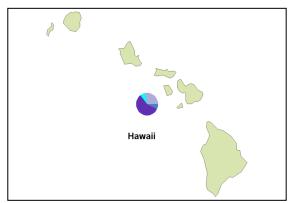

- ** The COVID-19 outbreak and its associated mitigation efforts occurring across the world, as well as lower healthcare seeking behavior, may have impacted ILI activity levels.
- ILI activity was minimal in all countries with available data.
- Laboratory-confirmed influenza cases have been reported in the Republic of Korea, Japan, and Hawaii this this season.
- Installation-level laboratory-confirmed influenza and COVID-19 case data for INDOPACOM can be found on page 11 of the report.

Influenza Activity: SOUTHCOM (2020-2021 Season: Week 50)

- ** The COVID-19 outbreak and its associated mitigation efforts occurring across the world, as well as lower healthcare seeking behavior, may have impacted ILI activity levels.
- ILI activity remained minimal in Honduras and Cuba.
- Only 1 laboratory-confirmed influenza case has been reported for SOUTHCOM for the 2020-2021 season (Influenza B).

^{*}Locations colored in dark gray have no Service Member medical encounter data.

Surveillance Programs and Data Sources

Defense Health Agency / Armed Forces Health Surveillance Division (AFHSD):

The Armed Forces Health Surveillance Division (AFHSD) is the central epidemiologic resource for the U.S. Armed Forces, conducting medical surveillance to protect those who serve our nation in uniform and allies who are critical to our national security interests. The Epidemiology and Analysis Section of AFHSD, the Epi Data Center of the Navy and Marine Corps Public Health Center, and the Air Force Satellite Office in Dayton, Ohio (Wright-Patterson AFB) have compiled data for this report from the following sources below.

Influenza-like Illness Activity:

Medical encounter and demographic data from the AFHSD's Defense Medical Surveillance System (DMSS) are used to generate portions of this report. ICD-10 codes from outpatient encounters are used to identify influenza-like illness (ILI). ILI is defined using the following codes: B97.89, H66.9, H66.90, H66.91, H66.92, H66.93, J00, J01.9, J01.90, J06.9, J09, J09.X1, J09.X2, J09.X3, J09.X9, J10, J10.00, J10.00, J10.01, J10.08, J10.1, J10.2, J10.8, J10.81, J10.82, J10.83, J10.89, J11, J11.0, J11.00, J11.00, J11.08, J11.1, J11.2, J11.81, J11.82, J11.83, J11.89, J12.89, J12.9, J18, J18.1, J18.8, J18.9, J20.9, J40, R05, R50.9.

The percentage of all outpatient visits that have an ILI code is calculated each week for all service members, regardless of component. These data are presented weekly for the current season and compared to the four prior seasons among service members. Influenza activity levels are calculated by comparing the mean reported percent of visits due to ILI for the previous two weeks to the mean reported percent of visits due to ILI during baseline weeks (defined as non-influenza weeks (weeks 22-39) over the past 3 years). There are four influenza activity levels, minimal, low, moderate, and high. The activity level corresponds to the number of standard deviations (SD) below, at or above the mean for the current 2 week period compared to the mean of the baseline weeks. Minimal activity corresponds to an influenza percentage that is less than 2 SD above the mean. Low activity corresponds to an influenza percentage that is equal to or greater than 4 SD above the mean, but less than 6 SD above the mean. High activity corresponds to an influenza percentage that is equal to or greater than 6 SD above the mean.

Influenza activity levels are presented in the Combatant Command (CCMD) maps, either by Installation, state, or country.

Influenza Positive Specimens:

Influenza lab results (HL-7 formatted data) are compiled and transmitted from the Navy and Marine Corps Public Health Center to AFHSD. Results obtained via PCR, viral culture, and rapid influenza assays are reported. Although the inclusion of rapid tests may underestimate the weekly and cumulative percent positive estimates due to false negatives, visibility of the positive rapid results provides valuable information for this surveillance report. Influenza types/subtypes are categorized as influenza A/not subtyped, influenza A(H1N1), influenza A(H3N2), influenza A and B co-infection, and influenza B. Additionally, laboratory-confirmed positive results are used to identify influenza-related hospitalization cases across the DoD.

The percent positivity is calculated by dividing the number of influenza positive specimens by the total number of specimens (positive and negative only; inconclusive results are excluded). The distributions of percent positive specimens by subtype are presented on a weekly basis for the entire influenza season. For each CCMD state, the distribution of subtypes for the previous 2 weeks are presented as pie graphs for states and countries. For installations, data are presented in tables with counts and percent positive by subtype for the past 2 weeks and for the entire season. The "change from last report" column reports the absolute difference in the percent positive from the prior week's report to the current week's report.

Surveillance Programs and Data Sources

COVID-19 Cases:

COVID-19 cases data are compiled from the COVID-19 positive lab results (HL-7 formatted data) and cases reported in the DRSi. COVID-19 cases in this report only include cases that have occurred since Week 41 of the influenza season, with the exception of the figure on page 1, which includes COVID-19 cases back to Week 1. The percent positivity calculation is restricted to only COVID-19 cases reported through the lab data so that an accurate denominator can be obtained. The percent positivity is calculated by dividing the number of COVID-19 positive specimens by the total number of specimens tested for COVID-19. For installations, COVID-19 case data are presented in tables with case counts for the past 2 weeks and for the entire influenza season (Week 41 to current). The "change from last report" column reports the absolute difference in the number of COVID-19 case counts from the prior week's report to the current week's report.

Pharmacy Transactions for Dispensed Influenza Antiviral Prescriptions:

HL7-formatted pharmacy transactions are used to assess the number of dispensed influenza antiviral (AV) prescriptions. Four influenza AV medications approved by the Food and Drug Administration (FDA) are recommended by the CDC for use in the United States (US) for the 2019-2020 influenza season: oral oseltamivir (Tamiflu® or generic), inhaled zanamivir (Relenza®), and intravenous peramivir (Rapivab®), and baloxavir marboxil (Xofluza®). These prescriptions are included in this surveillance. The overall count of dispensed AV prescriptions by week is presented graphically for the influenza season. A seasonal baseline is displayed with dispensed AV prescriptions. Surveillance thresholds are displayed with the count of inpatient dispensed AV prescriptions. Additionally, counts of inpatient dispensed influenza AV prescriptions are presented weekly for the influenza season.

Influenza Baselines, Thresholds, and Trends:

Weekly baselines used a three-year average to compare results with those from the same week during the previous three seasons. Bands for one and two standard deviations above seasonal baseline estimates are displayed to indicate when trends diverge with respect to timing or volume from those of recent seasons. The ILI, lab, and dispensed AV prescription data thresholds are calculated by adding two standard deviations to the off-season average.

Inpatient thresholds (lab and dispensed AV prescription data) are calculated by adding one standard deviation to the overall weighted average for in-season weeks. Weeks that represent at least 2% of the total season's laboratory-positive influenza cases for at least two consecutive weeks was considered to be "in-season" or influenza weeks; all other weeks are considered to be "off-season" or non-influenza weeks.
